We have found them to be very well thought out and made our programming much more efficient. A: Try learning Lisp. I really liked it and I use it daily. I'm not particularly into learning a new language (from scratch) but when I was starting out I really enjoyed learning Common Lisp and reading the SICP book. It was a great first book to learn a new language. It was very practical and showed me the real power of Lisp. I can't recommend the book too highly. It does what it says on the tin, and that's it. It's a very practical introduction to the power of Lisp, and to teaching programming. It's not a maths book, but it has plenty of maths. SICP Aoyama, Tokyo is a district of Minato Ward in Tokyo, Japan. The area has been the location of many studios and animation works of the Japanese animation industry. The main attractions of the area are the MAMBA (MANA) building in the Minato Ward Office building, and Tokyo's most famous "Alps" building, the Aoyama Cinema. The area is also known for its distinct post-war architecture, in particular the Aoyama Building of the Daiwa Securities Group. References External links Aoyama Category:Districts of Minato, TokyoSurgical treatment of cervical myelopathy in patients with degenerative cervical disease. During the period January 1986 through December 1990, 32 patients with cervical myelopathy were treated surgically. Fifteen patients were followed up for 2 years. These patients had a range of degenerative disease, and cervical canal stenosis with/without cord compression. Four patients with cervical fracture and three with cervical dislocation were also included in the study. The surgical treatment was performed on all 32 patients. In all patients decompression and stabilization were performed, and discectomy, corpectomy, or spinal fusion with/without interbody fusion were carried out. By combining anterior, posterior, and extraarticular surgery, decompression was accomplished in all patients. Stabilization was accomplished by anterior, posterior, or combined approaches. Cervical myelopathy was caused by a disc herniation in 20 patients, a cervical canal stenosis in 10 patients, and a fracture/dislocation in 2 patients. In four patients, the etiology was not identified. Clinical results at 2 years
